CTA Specification

Web Application Video Ecosystem – Web Media API Snapshot 2018

CTA-5000-A

December 2018
NOTICE

Consumer Technology Association (CTA)™ Standards, Bulletins and other technical publications are designed to serve the public interest through eliminating misunderstandings between manufacturers and purchasers, facilitating interchangeability and improvement of products, and assisting the purchaser in selecting and obtaining with minimum delay the proper product for his particular need. Existence of such Standards, Bulletins and other technical publications shall not in any respect preclude any member or nonmember of the Consumer Technology Association from manufacturing or selling products not conforming to such Standards, Bulletins or other technical publications, nor shall the existence of such Standards, Bulletins and other technical publications preclude their voluntary use by those other than Consumer Technology Association members, whether the document is to be used either domestically or internationally.

WAVE Specifications are developed under the WAVE Rules of Procedure, which can be accessed at the WAVE public home page (https://cta.tech/Research- Standards/Standards-Documents/WAVE-Project/WAVE-Project.aspx)

WAVE Specifications are adopted by the Consumer Technology Association in accordance with clause 5.4 of the WAVE Rules of Procedures regarding patent policy. By such action, the Consumer Technology Association does not assume any liability to any patent owner, nor does it assume any obligation whatever to parties adopting the Standard, Bulletin or other technical publication.

This document does not purport to address all safety problems associated with its use or all applicable regulatory requirements. It is the responsibility of the user of this document to establish appropriate safety and health practices and to determine the applicability of regulatory limitations before its use.

Foreword

The CTA WAVE Project was launched at the 2016 CES in Las Vegas, NV. The goal of WAVE is to improve interoperability in the commercial Over-the-Top (OTT) video ecosystem using industry-standard protocols including HTML5 with MSE Extensions [MEDIA-SOURCE] and EME [ENCRYPTED-MEDIA], MPEG-CMAF¹, MPEG-CENC² and adaptive bit-rate streaming protocols MPEG-DASH³ and Apple HLS⁴.

The process under which WAVE develops specifications is available online at the WAVE public home page (https://cta.tech/Research-Standards/Standards-Documents/WAVE-Project/WAVE-Project.aspx).

The Web Media API Snapshot 2018 was co-developed between the CTA WAVE HTML5 API Task Force and the W3C Web Media API Community Group. It is jointly published between CTA (as a CTA specification, CTA-5000-A) and W3C (as a Final Community Group Report), by agreement between the two organizations.

Web Media API Snapshot 2018

Abstract

This specification lists the web APIs to support media web apps that are supported across all four of the most widely used user agent code bases at the time of publication. This specification should be updated at least annually to keep pace with the evolving web platform. We encourage manufacturers to develop products that support the APIs in the most recent version of Web Media API Snapshot. This specification is comprised of references to existing specifications in W3C and other specification groups. The target devices will include any device that runs a modern HTML user agent, including televisions, game machines, set-top boxes, mobile devices and personal computers.

This specification is being developed as part of the CTA WAVE Project⁵.

Status of This Document

This specification was published by the Web Media API Community Group⁶. It is not a W3C Standard nor is it on the W3C Standards Track. Please note that under the W3C Community Contributor License Agreement (CLA)⁷ there is a limited opt-out and other conditions apply. Learn more about W3C Community and Business Groups⁸.

1 Introduction

This section is non-normative.

Writing portable media web apps across browsers on consumer products (e.g. smart TVs, game machines, set-top boxes) is much more difficult than writing portable media web apps across personal computer browsers. Two main reasons for this are that the browsers on consumer products are often quite out-of-date and that they often have integration issues.

1.1 Out-of-date browsers

While browsers integrated into consumer products are often built from the same major HTML user agent code bases as personal computer browsers, it is not unusual for a consumer product to be using a code base release that is three or more years old, while personal computer browsers use recent code base releases. Furthermore, browsers on consumer products are often infrequently updated, if ever. This results in very different web API support across devices.

This specification is intended to address this problem by listing key specifications used by media web apps that are all supported in common by all of the four major web user agent code bases at the time of publication. The specification will then be used to generate a test suite. The versions of each of the four code bases used to generate the test suite are listed on the front page of the test suite.

The specification and test suite enable device manufacturers to specify and verify that their browsers are up-to-date with current web standards at the time of product release. The specification and tests can also be used to specify and verify updates to browsers in the field.

Note that this specification is not defining a subset or profile to be used in place of the full web platform. There are additional specifications that are included in all code bases that are not included in this specification. Furthermore, individual code bases include APIs that are not supported on all other code bases but are nonetheless widely used. Therefore, this specification and associated tests should only be used as verification of a minimum set of current APIs. There is no suggestion that APIs not included in this specification should be removed from implementations.

It is intended that this specification be updated periodically to reflect adoption of new specifications in the web platform. For example, the specification might be updated once a year for media devices being introduced onto the market in the following year.

---

1.2 Integration issues

There are many issues during integration of a web user agent with a hardware device that can affect the operation of web APIs. For example, if insufficient memory is allocated for cookies, they won’t function as intended.

To address this issue, this specification includes a list of target values for several APIs which are known to have been impacted by integration issues. There will also be a test suite to verify these values are supported on a device. It is expected that additional integration requirements will be added in future updates.

Note that these values are not mandated by any web standards but are based on measurement of values supported by popular browsers. Supporting these values should provide better interoperability of web applications with personal computer and mobile browsers. Manufacturers may choose to exceed these values based on their expected application environments.

2 Conformance

As well as sections marked as non-normative, all authoring guidelines, diagrams, examples, and notes in this specification are non-normative. Everything else in this specification is normative.

The key words MUST and SHOULD are to be interpreted as described in [RFC2119].

3 Web Media APIs Currently Supported on all Platforms

3.1 Introduction

This section is non-normative.

This section lists the web APIs to support media web apps that are supported across all four of the most widely used user agent code bases at the time of publication. We encourage manufacturers to develop products that support the APIs in the most recent version of this specification.

The approach taken in this draft is only to include specifications that are of particular significance to authors, but not include all the specifications cited by those included specifications. For example, HTTP is required by the HTML spec and is therefore not included here.
3.1.1 Features with limited implementation

Parts of some web specifications are not currently implemented across all user agent code bases and may never be. Consequently, these features will not be included in our tests. Any such features are noted as exceptions under that API.

3.1.2 At-risk features

Some specifications referenced in this section may not have reached Recommendation and, as such, may contain ‘at-risk’ features. Since the most common reason for features being marked as at-risk is lack of implementations, such features may not be present in some implementations of this specification and will not be tested as part of our tests.

3.2 Client code updates

The W3C Technical Architecture Group released a finding called The Evergreen Web which strongly recommends that “browsers must be regularly updated, especially to fix security and interoperability bugs — ideally with an automatic, secure update mechanism” [EVERGREEN-M3].

Devices SHOULD regularly update their browsers, preferably automatically.

3.3 Core web specifications

Devices MUST be conforming implementations of the following specifications:

- DOM [DOM]
- HTML [HTML]
  - Note: Must support the conformance class Web browsers and other interactive user agents.
  - Exceptions:
    - Server-Sent Events are not yet widely supported.
    - SharedWorker is not yet widely supported.

3.4 CSS specifications

Devices MUST be conforming implementations of the following specifications (CSS Snapshot 2017 [CSS-2017]):

- Cascading Style Sheets Level 2 Revision 1 (CSS 2.1) Specification [CSS2]
- Compositing and Blending Level 1 [COMPOSING]

---

10 See https://w3c.github.io/webmediaapi/#bib-evergreen-web.
3.5 Media specifications

Devices **MUST** be conforming implementations of the following specifications:

- Encrypted Media Extensions [ENCRYPTED-MEDIA]
- Media Source Extensions [MEDIA-SOURCE]
- Scalable Vector Graphics (SVG) 1.1 (Second Edition) [SVG11]
- Web Audio API [WEBAUDIO]
  - Exceptions: Since not all environments currently support Media Streams [MEDIACAPTURE-STREAMS], MediaStreamAudioSourceNode and MediaStreamAudioDestinationNode are not yet widely supported.

3.6 Graphics specifications

Devices **MUST** be conforming implementations of the following specifications:

- Fullscreen API Standard [FULLSCREEN]
- Graphics Interchange Format [GIF]
- HTML Canvas 2D Context [2DCONTEXT]
- JPEG File Interchange Format [JPEG]
- Portable Network Graphics (PNG) Specification (Second Edition) [PNG]
- WebGL Specification [WEBGL-103]
3.7 Font specifications
Devices MUST be conforming implementations of the following specifications:
- Open Font Format [OPEN-FONT-FORMAT]
- WOFF File Format 1.0 [WOFF]

3.8 Networking specifications
Devices MUST be conforming implementations of the following specifications:
- Fetch [FETCH]
- XMLHttpRequest [XHR]
- Note: Web sockets is also required as part of the HTML specification [HTML].

3.9 Security specifications
Devices MUST be conforming implementations of the following specifications:
- Content Security Policy Level 2 [CSP2]
- Web Cryptography API [WEBCRYPTOAPI]

3.10 Other web specifications
Devices MUST be conforming implementations of the following specifications:
- Indexed Database API [INDEXEDDB]
  - Exceptions: array keyPath and array key are not yet widely supported.
- File API [FILEAPI]
  - Exception: File constructor is not yet widely supported.
- Notifications API [NOTIFICATIONS]
- Page Visibility Level 2 [PAGE-VISIBILITY-2]
- Service Workers 1 [SERVICE-WORKERS-1]
- UI Events [UIEVENTS]
- Note: Cross-document messaging, Channel messaging, Web storage and Web workers are also required as part of the HTML specification [HTML].

4 User Agent Integration Specifications

4.1 Introduction
This section is non-normative.
This section contains values for integrating a web user agent with a consumer device. The values are based on de facto requirements from browsers on personal computers and mobile devices. Supporting these integration specifications will increase interoperability with media web apps on other devices.
A test suite will evaluate client support for these specifications.
4.2 Cookies

- Devices MUST support cookies of length at least 4096 bytes.
- Devices MUST support at least 20 cookies per domain.
- Devices MUST support at least 100 total cookies.
- Devices MUST support persistence of cookies between application sessions.
- Devices MUST support persistence of cookies across power cycles of the device.

4.3 URLs

- Devices MUST support URLs up to a length of 2047 bytes.

5 Web Media APIs Proposed to be Supported on all Platforms

This section is non-normative.

5.1 Introduction

APIs in this section are important for web media delivery but are not yet implemented in all four code bases. We encourage the following APIs be implemented on all HTML user agents as soon as possible. It is expected that, as implementations become available, some of these specifications may be listed as supported on all platforms in a future version of this specification.

5.2 Media specifications

- Media Fragments URI 1.0 (basic) [MEDIA-FRAGS]
- Media Session Standard [MEDIASESSION]
- Sourcing In-band Media Resource Tracks from Media Containers into HTML [INBANDTRACKS]

5.3 Other web specifications

- Web App Manifest [APPMANIFEST]
